Background information for suppliers

# EXPECTED TIMELINE FOR THE RFI

1

2

3

4

5

## Expected Timeline for the RFI

Activity	Time estimate
Public announcement of RFI	April 13th 2021
Deadline for submitting finished questionnaire	April 26th 2021, 12.00 CET
Announcement of who will be chosen for dialogue meetings	End of April 2021
Dialogue meetings	During May 2021
Publishing of findings on Rejsekort & Rejseplans website	June-July 2021

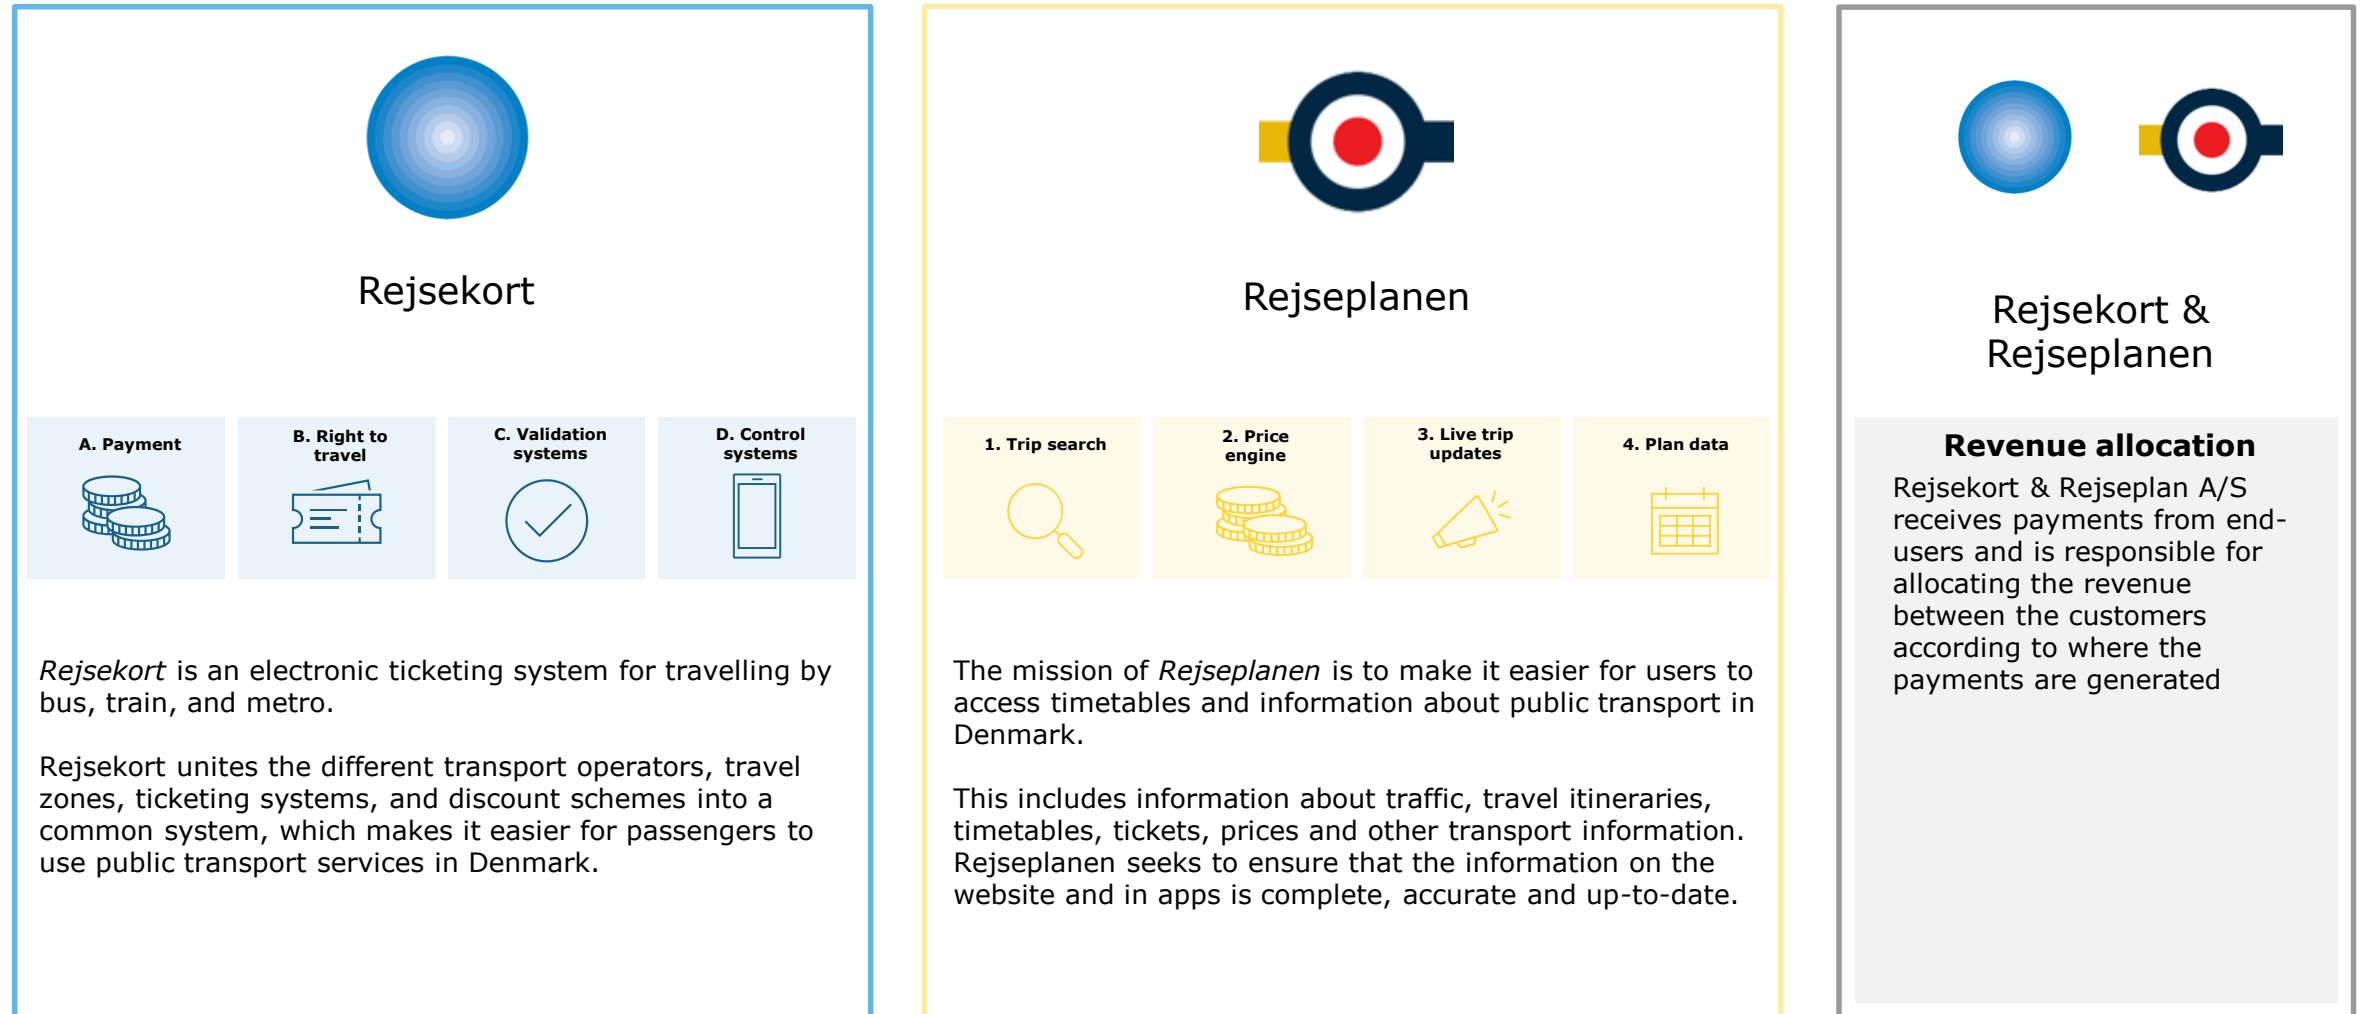

# CORE SERVICES

# Core services

The core services provided to the customers\* and end-users of Rejsekort & Rejseplan A/S can be divided into three main categories:

\*Mobility providers connected to the platform

# Services – Rejsekort

Rejsekort & Rejseplan A/S provides 9 primary services to its customers\* and end-users

## Main services

The primary services necessary for completing a journey

### A. Payment

- Online payment (CWS)
- Automatic payment (refill)
- Vending machine
- Self-service and customer center
- Payment and collection

### B. Right to travel

- Provide a physical Rejsekort
- Analogue ticket
- Rejsekort e-wallet
- Subscription products
- Education discount

### C. Validation systems

- Card reader (check in/check out)
- App for checking in/out
- Rejsekort status app

### D. Control systems

- Opportunity to conduct ticket inspection throughout any trip
- Opportunity to post control (fraud analysis and management)

## Supporting services

Handling and administrating data, agreements, media etc. That support the main services

### E. End-user contact

- Creating, maintaining, and terminating users
- Customer service via phone and email
- Automatic mail system

### F. Ticket media and payment

- Creating, maintaining, and terminating Rejsekort
- System for cash-payment in busses
- Revenue distribution between traffic companies
- Handle excess liquidity

### G. Tariff system and price calculations

- Guidance and updating of existing tariff systems
- Price calculations based on pricing structure from Rejsekort and Rejseplanen

### H. Data & statistics

- Trip data via portal-solution (Infoweb and Visual Analytics) and data transfer (FTP)
- Validation of missing check-out
- Reporting, analysis, and statistics

## Administration

Ongoing maintenance and operations of the system and infrastructure.

### I. Systems operations & development

- Operations is outsourced to Thales, who are monitoring through their own software and hardware
- Monitoring and reporting
- IT-development of product portfolio through demand management and project prioritization (ServiceNow)

\*Mobility providers connected to the platform

# Services – Rejseplanen

Rejsekort & Rejseplan A/S provides 7 primary services to its customers\* and end-users

## Main services

- Rejseplan to end-user via web, iOS, and Android (1, 2, 3, and 4)
- Rest-API to traffic companies (1, 2, 3, and 4)
- Rest-API without prices to other prices (1, 3, and 4)
- Real time to TUS screens via data feed (3 and 4)

## Supporting services

Statistics and data analysis

## Administration

Ongoing system operations and development

Collaborate and connect other travel services

### 1. Trip search

- Address based travelling plan across all public transport, as well as domestic flights
- Opportunity to show other travel services in line with business rules (xMode)
- Map via GPS on app
- Store frequently visited places (e.g home or work)
- Show departure info. at specific stop or station
- Show travel schedule

### 2. Price engine

- Real time price showing of all public transport trips in whole of Denmark
- The price engine needs to generate prices to single trip ticket, as well as subscription products to all PTO's

### 3. Live trip updates

- Collection of reported live departure times for bus, metro, and trains from all PTO's, including possible delays or changes
- Show reported live times on app and web
- Send push notification to users who have chosen to follow a trip
- Live updates on TUS screens at all locations

### 4. Plan data

- Collect and quality check of trip schedule from traffic companies
- Release of searchable trip data in Rejseplan
- Release of trip data (without live update) every 14 days in GTFS format to Google, Apple, etc.

### 5. Statistics

- Search history allows for the opportunity to analyze statistical data such as, geography, travel plan, switching stops etc. (not fully implemented)

### 6. System operations and development

- Monitoring and reporting (the operations is outsourced to Hacon who monitors software, servers, etc.)
- IT-development of product portfolio through demand management and project prioritization (ServiceNow)

### 7. Connecting other travel services

- Partnership with other transportation providers, connection with Rejseplanen, as well as operations and development of other transportation providers

# FRAMEWORK CONDITIONS THE DANISH TRANSPORT SYSTEM

1

2

3

4

# THE DANISH TRANSPORT NETWORK

In the Danish public transport network, several transport companies are responsible for the ticket revenue and for managing and operating transport services. By the submission of Bill L206 a main target is to meet the end-users with one collected mobility service. In the following you will get a brief description the framework conditions that are mandatory to take into account when delivering mobility as a service to the Danish transport network.

In the context of inspection of a Rejsekort, a transport operator network topology is composed by of number of elements that are used to describe both the geographical topology of the network and the operator transport services network. These elements are briefly described in the following pages.

In the context of journey planning Journey planning is done through a search algorithm that will have to take both business rules and different transportation modes into account.

Business rules shall give Rejsekort & Rejseplan A/S the opportunity to configurate travel guide suggestions, based on business rules.

# The Danish transport system - Journey planning

Journey planning is done through a search algorithm that will have to take both business rules and different transportation modes into account

## Transportation modes

## Business rules

### Traditional mobility services

### Other mobility services

#### Types of transportation

- Train
- Metro
- Bus
- Ferry (Harbor shuttle)
- Light rail system
- Domestic flights

- Demand Responsive Transport, e.g Flextrafik
- Carpooling
- Bike sharing
- Car sharing
- Scooters

#### Characteristics

- Fixed places for departure and arrival
- Fixed Timetables
- Unlimited capacity
- Can be plan far ahead

- Random places for departure and arrival
- No timetables
- Limited capacity
- Only here-and-now planning

#### Dependencies

- Geo-data and Stop-placement data
- Zone structure and tariffs for price calculation

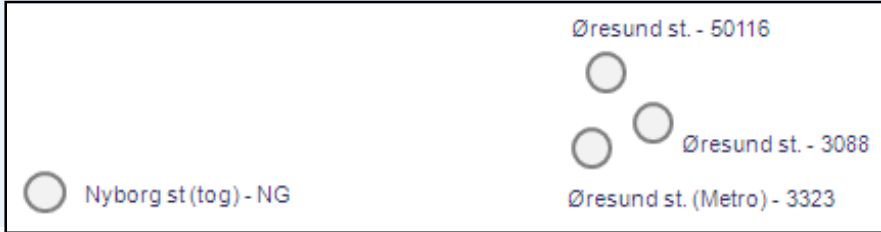

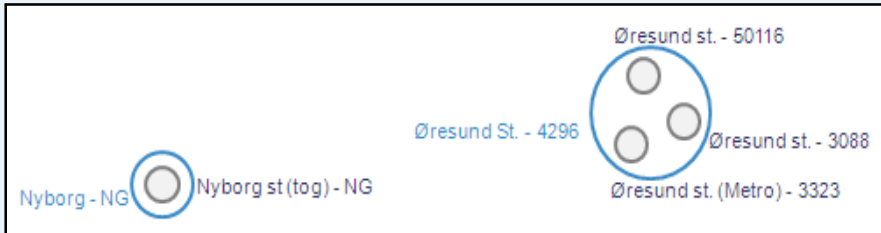

- Geo-data locating units

Opportunity to configurate travel guide suggestions, based on business rules, for example:

- Number of routes/travels shown
- Prioritize importance of number of shifts vs travel time
- Rules around walking distance
- Rules around choice of transportation mode
- Take travel restrictions into account
- Etc.

# Rejsekort – topology

1/2

Topology	Description	Illustration																																																					
<b>Stop point</b>	<p>The <b>Stop Point</b> is the basic and smallest topologic entity needed to define the network.</p> <p>A stop point is defined in the system by its GPS coordinates and its size (radius).</p> <p>A stop point is attached to a single <b>fare reference point</b>.</p>																																																						
<b>FARE REFERENCE POINT</b>	<p>Another topology entity is the Fare Reference Point, which is a Fare location, i.e. the fare calculation smallest entity.</p> <p>A fare point is a group of stop points, e.g. located on a station or at crossroads</p> <p>A fare point is defined in the system by its GPS coordinates and its size (radius).</p> <p>A fare point can be attached to several <b>zones</b> but must be directly attached to a single <b>fare authority area</b>.</p>																																																						
<b>FARE AUTHORITY AREA DEFINITION</b>	<p>A fare authority area (or domain) is a geographical area managed by a Fare authority, and with a common set of fare parameters and rules (fare set).</p> <p>A fare authority area is defined as set of fare reference points, zones, and possibly other fare authority area.</p> <p>Fare authority areas are used to:</p> <ul style="list-style-type: none"><li>Calculate a price</li><li>Check and/or limit geographical validity of a Season Pass product.</li></ul>	<table><tr><th colspan="13">Danmark 2002</th></tr><tr><th colspan="10">Fyn-Jylland 20021</th><th colspan="3" rowspan="2">Sjælland 2006</th></tr><tr><th colspan="5">Midttrafik 2008</th><th colspan="4">Sydtrafik 2007</th><th colspan="3">Fyn 2010</th></tr><tr><td>NT 2009</td><td>MTM 20081</td><td>MTV 20083</td><td>MTØ 20084</td><td>MTS 20082</td><td>SYDV 20076</td><td>SYDØ 20075</td><td>SYDS 20077</td><td>SYDFL 20078</td><td>FynV 20102</td><td>FynM 20101</td><td>FynØ 20103</td><td>TMV 2005</td><td>TMH 2001</td><td>TMS 2004</td></tr></table>	Danmark 2002													Fyn-Jylland 20021										Sjælland 2006			Midttrafik 2008					Sydtrafik 2007				Fyn 2010			NT 2009	MTM 20081	MTV 20083	MTØ 20084	MTS 20082	SYDV 20076	SYDØ 20075	SYDS 20077	SYDFL 20078	FynV 20102	FynM 20101	FynØ 20103	TMV 2005	TMH 2001	TMS 2004

# Rejsekort – topology

2/2

## Topology

## Description

## Illustration

<b>Zone</b>	<p>The topology of the REJSEKORT system transport network is based on zone decomposition. These zones are organized in a grid. The network looks like the following example</p> <p>Zones are used to:</p> <ul style="list-style-type: none"><li>• Calculate a price in a zone based fare system</li><li>• Define the geographical validity of a Season Pass product.</li></ul> <p>A zone is defined as a set of fare reference points.</p>	
<b>Zone-group</b>	<p>A <b>zone-group</b> (or <b>maxi-zone</b>) is a set of zones. They can be used for the definition of the geographical validity of a Season Pass product.</p>	
<b>LINES</b>	<p>The topology of the transport network is based on <b>Lines</b> decomposition</p> <p>Lines are used to limit geographical validity check.</p> <p>The definition of entities according to line decomposition is the following:</p> <p>A <b>service pattern (or service journey)</b> is a set of ordered stop points where the vehicle (bus, train, ferry...) will successively stop during its service.</p> <p>A <b>line</b> is a set of service patterns. For example, for the same bus line, it is possible to have an omnibus service (service pattern will contain all possible points of the line) or an express service (only some main points will be served by the bus).</p> <p>A <b>Trip</b> is a single departure to one service pattern and one day type. Trip concerns only bus lines definition.</p>	

# Overview slide

Supplier capability threshold to meet the needs of the platforms Rejsekort and Rejseplanen

Rejsekort

- Number of end-users:
  - 3.1 million active travel cards
  - 1.1 million active top-up agreements
- 420 million annual transactions
- 4.2 billion DKK annual turnover on behalf of PTA's
- The legacy system includes 19.000 validation points for check in/check out distributed all over the country and covering both fixed positions at stations and onboard equipment (buses)
- 99.9% System up-time

Rejseplanen

- 4.5 million downloads (4th most popular App in Denmark)
- 1.2 million daily searches by end-users (App and web)
- 0.6 million daily calls to the RP Rest-API
- System up-time 99.9%
